

`a1-b1-c2-d1-e2`:

Possible tour `A-C-B-D`. Probable candidate, since this has 4/4 cities. But, since $\neg AD$ is in the path and `AD` is part of the tour considering the circular nature of the original tour, it must be extended to city `E`, to obtain `A-C-B-D-E`.

`a1-b1-c2-d2`:

Possible tour `B-A-C-D`. Probable candidate, since this has 4/4 cities. But since $\neg BD$ is in the path and `BD` is part of the tour considering the circular nature of the original tour, it must be extended to city `E`, to obtain `B-A-C-D-E`.

`a1-b2-c3-d3`:

Possible tour `A-D-B-C`. Probable candidate, since this has 4/4 cities. But since $\neg AC$ is in the path and `AC` is part of the tour considering the circular nature of the original tour, it must be extended to city `E`, to obtain `A-D-B-C-E`.

`a1-b2-c3-d4`:

Possible tour `A-D-C-B`. Probable candidate, since this has 4/4 cities.

`a1-b2-c4`:

Possible tour `A-B`. Not probable, since it involves only 3/4 cities.
