

$\beta_n \beta_{-1} : D, A, S, D, k$

$\beta_n \beta_{-3} \quad g+0=f$

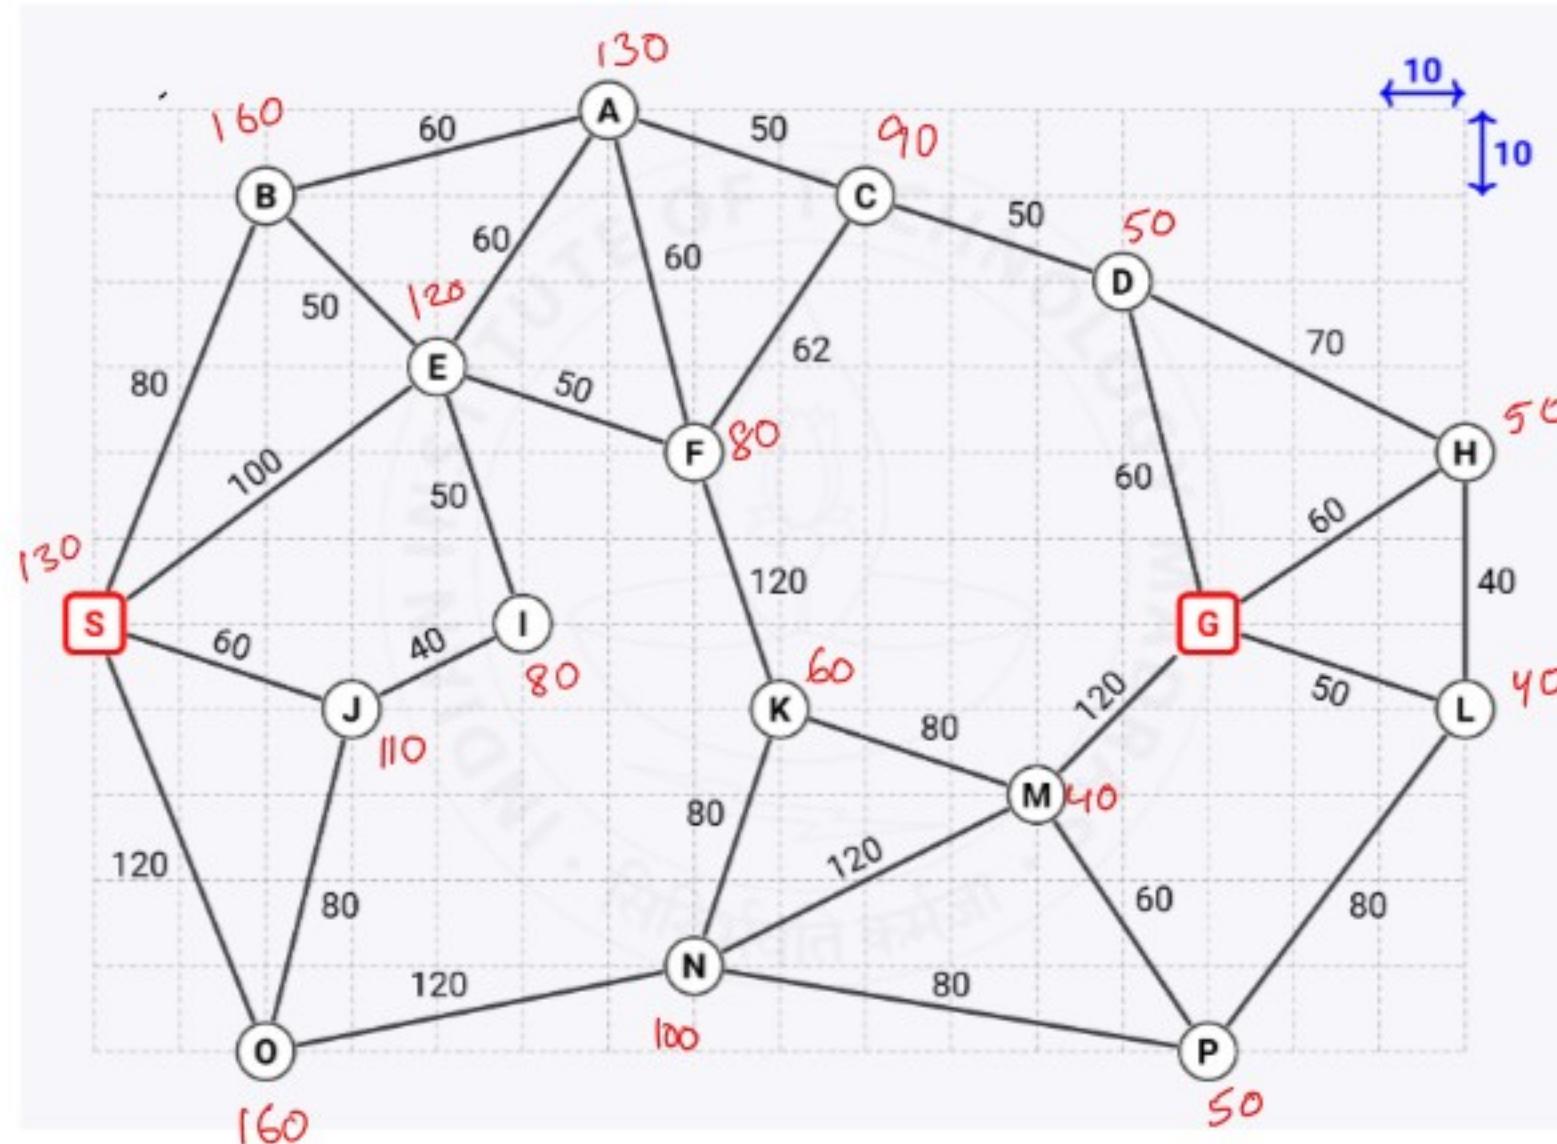

$\beta_n \beta_{-2} : D, A, E, B, A$
 $2, 4, 6, 7, 10$

since, h is over estimating, A* lost optimality

$$h^*(c) = 2 \quad \text{but } h(c) = 3 > h^*(c)$$

$$g+h = f$$
