Question 3 : 640653766052

Total Mark : 0.00 | Type : COMPREHENSION

The figure shows a map with several locations on a grid where each tile is 1x1 in size. The locations are at grid points and are connected by two way edges (roads), where each edge has a cost that is the same in both directions. Observe that the edge costs are not necessarily proportional to the coordinate based distance estimates. The start node is S and the goal node is G, the MoveGen function returns neighbours in alphabetical order. Use Manhattan distance as the heuristic function. Tie-breaker: when several nodes have the same best cost, use alphabetical order to break ties. Emulate A*, WA* and Branch-and-Bound on the given map, then answer the given subquestions.

Your score : 0

Question 4 :

**Question 25 : 640653766074**

Total Mark : 0.00 | Type : COMPREHENSION

The domain description of a blocks-world with a single one-armed robot is provided below. **Note:**

this is the same domain description used in the weekly assignments. Based on the above data, answer the given subquestions.

**PREDICATES**

armEmpty The arm is not holding any block, it is empty.
holding(X) The arm is holding X.
onTable(X) X is on the table.
clear(X) X has nothing above it, it is clear.
on(X,Y) X is directly on Y.

OPERATORS

Pickup(X): pick up X from the table.

Preconditions: { armEmpty, clear(X), onTable(X) }
 Add Effects : { holding(X) }
 Del Effects : { armEmpty, onTable(X) }

Putdown(X): place X on the table.

Preconditions: { holding(X) }
 Add Effects : { armEmpty, onTable(X) }
 Del Effects : { holding(X) }

Unstack(X,Y): pick up X that is directly sitting on Y.

Preconditions: { armEmpty, clear(X), on(X,Y) }
 Add Effects : { clear(Y), holding(X) }
 Del Effects : { armEmpty, on(X,Y) }

Stack(X,Y): place X directly on top of Y.

Preconditions: { holding(X), clear(Y) }
 Add Effects : { armEmpty, on(X,Y) }
 Del Effects : { holding(X), clear(Y) }

Tie-breaker: When actions are chosen non-deterministically, choose actions that lead to a plan. Throw away the actions that lead to deadends and cycles.

Tie-breaker: Treat the goal description, preconditions and effects as lists that are accessed from left to right. When the elements in a list are pushed one by one to a stack, the last element in the list will be at the top of the stack. It has the effect of reversing the list.

A planning problem is given below, find a plan using the operators and predicates defined in the blocks-world domain.

on(C,D) }
